

How a document becomes evidence

This sample exists so the Nemesis reader can be checked without signing in. It carries the shapes a real source carries: headings, running text, a table, and enough pages to make thumbnails and page navigation meaningful.

Every page below is plain, selectable text. If you can drag-select this sentence, the text layer is working and citations can point at it.

Structure is what makes a page addressable

A reader that only shows pixels can show you a page. A reader that knows the document's structure can take you to a section, quote it, and prove where the quote came from.

Headings, lists and tables are not decoration. They are the addresses that a citation resolves against. Losing them during extraction is what turns a citation into a guess.

The word ARBITRARY appears once on this page and once on page four, so that in-page search has something to find in more than one place.

A table, drawn as a table

Column relationships survive here as position rather than as a flat list:

Representation	Powers	Authoritative
Original file	Source mode, download	Yes
Visual	Page and slide rendering	Faithful copy
Structured parse	Search, retrieval, AI	Derived

The original stays authoritative

Reading mode is derived. It is a cleaned-up rendering of what the parser extracted, and it exists for comfort, not for proof.

Source mode is the original: the real page, the real layout, the real wording. When the two disagree, the original wins, and anything ARBITRARY that the reconstruction invented is a bug in the reconstruction.

This is the last page of the sample.
