

Section 1

A document states what it contains before anything reads it. The structure of a page is separate from the words printed on it. Where a figure sits is a fact about the page and not about its meaning. A measurement recorded without its method is a nuance. Content that was seen and not converted is a gap, not an absence. The cheapest correct answer is still the correct answer. Reading order is a claim about intent and should be labelled as one. An identifier that repeats is an identifier that cannot be repeated. A document states what it contains before anything reads it. The structure of a page is separate from the words printed on it. Where a figure sits is a fact about the page and not about its meaning. A measurement recorded without its method is a nuance. Content that was seen and not converted is a gap, not an absence. The cheapest correct answer is still the correct answer. Reading order is a claim about intent and should be labelled as one. An identifier that repeats is an identifier that cannot be repeated.

Section 2

The cheapest correct answer is still the correct answer. A threshold chosen before the data is a preference wearing a num
An identifier that repeats is an identifier that cannot be trusted. What survives persistence is the only thing a later question
The structure of a page is separate from the words printed on it. Every locator must point at something that existed before
A measurement recorded without its method is a number nobody can check. Two readers of the same file should not disag
The cheapest correct answer is still the correct answer. A threshold chosen before the data is a preference wearing a num
An identifier that repeats is an identifier that cannot be trusted. What survives persistence is the only thing a later question
The structure of a page is separate from the words printed on it. Every locator must point at something that existed before
A measurement recorded without its method is a number nobody can check. Two readers of the same file should not disag

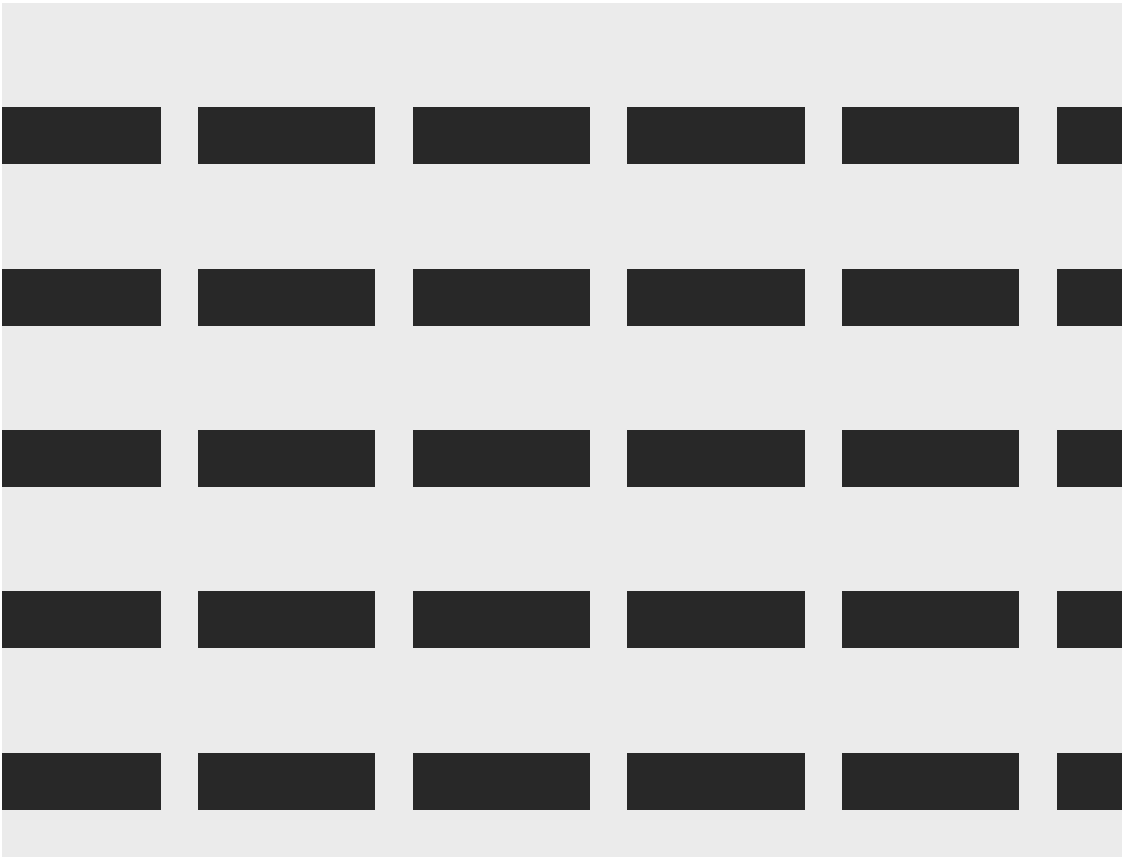

Section 3

Every locator must point at something that existed before the parse began. Where a figure sits is a fact about the page and
Two readers of the same file should not disagree about how many pages it has. Content that was seen and not converted
A threshold chosen before the data is a preference wearing a number. Reading order is a claim about intent and should be
What survives persistence is the only thing a later question can ask about. A document states what it contains before anyth
Every locator must point at something that existed before the parse began. Where a figure sits is a fact about the page and
Two readers of the same file should not disagree about how many pages it has. Content that was seen and not converted
A threshold chosen before the data is a preference wearing a number. Reading order is a claim about intent and should be
What survives persistence is the only thing a later question can ask about. A document states what it contains before anyth

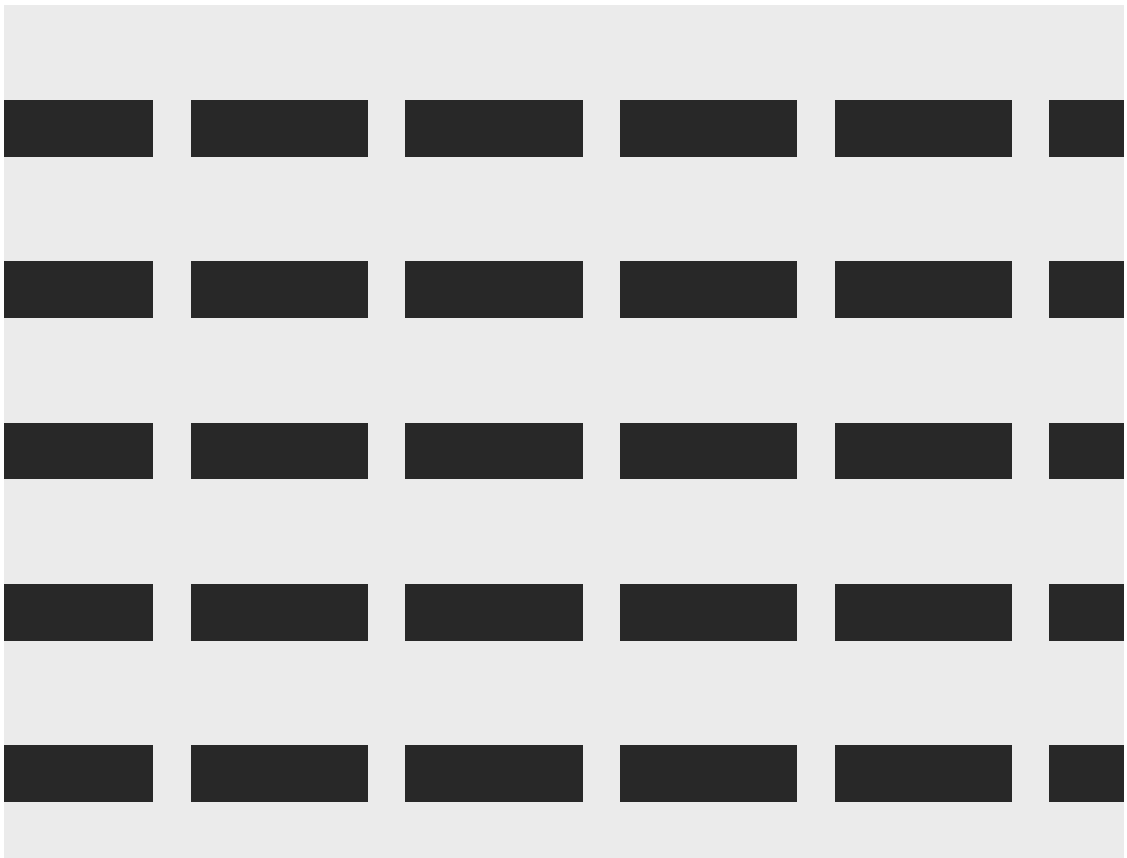

Section 4

Reading order is a claim about intent and should be labelled as one. An identifier that repeats is an identifier that cannot be
A document states what it contains before anything reads it. The structure of a page is separate from the words printed on
Where a figure sits is a fact about the page and not about its meaning. A measurement recorded without its method is a nu
Content that was seen and not converted is a gap, not an absence. The cheapest correct answer is still the correct answer

Content that was seen and not converted is a gap, not an absence. The cheapest correct answer is still the correct answer

Section 5

A measurement recorded without its method is a number nobody can check. Two readers of the same file should not disagree. The cheapest correct answer is still the correct answer. A threshold chosen before the data is a preference wearing a number. An identifier that repeats is an identifier that cannot be trusted. What survives persistence is the only thing a later question can ask. The structure of a page is separate from the words printed on it. Every locator must point at something that existed before. A measurement recorded without its method is a number nobody can check. Two readers of the same file should not disagree. The cheapest correct answer is still the correct answer. A threshold chosen before the data is a preference wearing a number. An identifier that repeats is an identifier that cannot be trusted. What survives persistence is the only thing a later question can ask. The structure of a page is separate from the words printed on it. Every locator must point at something that existed before.

Section 6

What survives persistence is the only thing a later question can ask about. A document states what it contains before anything else. Every locator must point at something that existed before the parse began. Where a figure sits is a fact about the page and not about the data. Two readers of the same file should not disagree about how many pages it has. Content that was seen and not converted is a fact about the data. A threshold chosen before the data is a preference wearing a number. Reading order is a claim about intent and should be respected. What survives persistence is the only thing a later question can ask about. A document states what it contains before anything else. Every locator must point at something that existed before the parse began. Where a figure sits is a fact about the page and not about the data. Two readers of the same file should not disagree about how many pages it has. Content that was seen and not converted is a fact about the data. A threshold chosen before the data is a preference wearing a number. Reading order is a claim about intent and should be respected.
